

AUDIENCE RESEARCH, WOVEN INTO STRATEGY

Audience Voices

What 163 people told us. What we do next.

A four-volume study of the apps, shows, services and teams our audience lives with, and how that becomes content, media and measurement for a Southstate injury firm.

October 2026

163 VOICES, ONE PICTURE

About this compendium: what it is and how to use it

What this is. In late 2025, 163 people from our former-client, friends-and-family and Facebook networks told us which apps, shows, services, websites and teams they use. This compendium describes what they said, tests which interests truly go together, and turns that into direction for our content, media and measurement.

Who it is for. Anyone who plans, writes, approves or buys marketing for the Firm. You do not need a statistics background; every test is explained in plain terms the first time it appears.

What it can and cannot do. It shows what this audience uses and which interests travel together. It cannot show who saw an ad, what persuaded anyone, or which campaign will produce signed cases. Only testing can, and Volume 04 shows how.

You do not need to read it all at once. Start with [Key findings](#) (p. 5) and [What to do first](#) (p. 6). Writers go to [Content pillars](#) (p. 39). Media buyers go to [Buying streaming TV and audio](#) (p. 45).

Survey fielded November 2 to December 3, 2025. Analysis and writing completed October 2026. Every number traces to the companion workbook (Appendix D, p. 63).

Contents: four volumes and the appendices

Part	What it covers	Page
Start	About this compendium, the study at a glance, key findings, what to do first	2
Volume 01: The audience	Who answered and what they use: apps, time online, websites, streaming TV, audio, ad-supported access, reach	7
Volume 02: Connections	Which interests truly go together, two viewer groups, sports, platforms and timing	22
Volume 03: Direction	Content principles, pillars, tone, brand assets, channels, buying, search and compliance	36
Volume 04: Proof	Tests, sample sizes, measurement, a three-month roadmap, the next survey and limits	49
Appendices	Methods, every result that holds, codebook, data guide and references	58

How each page works. The blue label names the volume. The title says what the page does. A bold phrase opens each key paragraph. The line above the footer names the page owner and the next review date.

The study at a glance

Item	Detail
Design	A one-time survey. We describe answers and test which ones go together.
Field period	November 2 to December 3, 2025
Who answered	163 valid responses; 159 with Southstate ZIP codes. Recruited through the firm's networks, not sampled at random.
What we asked	Home ZIP; social apps; free ad-supported streaming; daily social time; show types; TV services; sports and teams; websites; audio; audio plan; usual times of day; interest in a survey panel.
How we analyzed it	Shares with 95% intervals; odds ratios; Fisher exact tests; false discovery control; adjustment for people who tick many boxes; cluster checks; permutation tests; latent class analysis.

Figure 1 The audience in six numbers. People out of 163.

Key findings: ten things this research shows

Finding	
1	Facebook is the shared platform: 139 of 163 use it, and adding Instagram, Tik Tok and YouTube lifts reach only to 154.
2	Half spend three hours or more a day on social media. Heavier users use more apps of every kind, not one app in particular.
3	Before 9 AM is the most common usual time, but the survey cannot name a best posting hour.
4	Local news websites reach half the audience (83 people).
5	Netflix leads streaming TV (77%), two thirds use a free ad-supported app, and TV plus audio together reach almost everyone.
6	Reality and lifestyle shows go together more than any other pair (adjusted odds ratio 4.17). Sports with news, family with lifestyle and comedy with drama also hold.
7	Drama viewers choose sports and news less often than expected.
8	Two viewer groups emerge: selective viewers (71%) and broad story viewers (29%). Interest in sports and news is the same in both.
9	Local teams are a shared reference (79% follow State University or the pro team), but only NFL following goes with watching sports shows.
10	No content interest belongs to one platform once box-ticking is accounted for.

An odds ratio of 1 means no link; above 1, people who chose one answer were more likely to choose the other. "Adjusted" means we accounted for how many options each person chose ([How we tested connections](#) (p. 23)).

What to do first: five decisions

Decision	Why the evidence supports it
Lead with answers. Give every channel short, practical next steps after a wreck.	Interest in news-style information is the same across both viewer groups, and half the audience reads local news sites.
Add everyday stories for the people who want them.	Broad story viewers (29%) choose comedy, drama, family, reality and lifestyle together; reality with lifestyle is the firmest pairing.
Stay close to home. Set content on Capital City and Riverside County roads, in local-news style.	Local news reaches 51%; local teams reach 79% as a shared reference.
Keep one message and the same brand assets everywhere, starting on Facebook.	Facebook covers 85%; no platform has its own content interest.
Test before you scale, and judge by the case-evaluation button submissions, verified leads and signed cases.	The survey describes interests, not persuasion. Volume 04 sizes each test.

VOLUME 01, WHO WE HEARD FROM

The audience

Know who answered and which apps, websites, services and channels they use.

Start with [How the survey worked](#) (p. 8). The reach planning tables are on [Reach](#) (p. 14) and [Combined coverage](#) (p. 19).

01

WHO WE HEARD FROM

How the survey worked: design, recruitment and questions

Design. A one-time survey: each person answered once, from November 2 to December 3, 2025. We describe how often each answer was chosen and, in Volume 02, test which answers go together.

Recruitment. We shared the survey through our former-client and friends-and-family networks, including Facebook groups. The results describe this group well. They are not estimates for all Southstate residents or for everyone who needs a lawyer (Baker et al., 2013).

Question	Format
Which social media apps do you use?	Check all that apply
About how much time do you spend on social media each day?	One of four groups
What time(s) of day do you usually use these platforms the most?	Select two
Which kinds of websites do you visit most?	Check all that apply
Which streaming TV services do you use?	Check all that apply
Do you use any free, ad-supported streaming apps?	Yes or no
How do you listen to music, talk shows or podcasts?	Check all that apply
For music or radio apps, which plan do you use?	Free with ads, paid, or both
What kinds of shows do you watch most on streaming TV?	Check all that apply
Which sports or teams do you watch or follow?	Check all that apply

One rule for "None". Some people answered "None". We count that as a real answer, meaning no on every option of that question, so all 163 people appear in every result.

Who answered: where people live and who will help again

Figure 2 Where respondents live. The eight most common home ZIP codes, people out of 163.

Close to our offices. 159 of 163 gave Southstate ZIP codes; 107 live in the first ZIP area and 23 in the second. ZIP ZIP A, home to our Riverside office, alone holds 46 people (28%). The audience sits squarely in our Capital City and Riverside County service area.

Why the concentration matters. Neighbors and relatives often answer alike. We checked every firm result with tests that allow for this clustering, and they held, but treat the group as close-knit rather than as independent strangers.

Ready to help again. 103 people (63%) said they would join a survey team, a ready starting pool for the next study.

50 ZIP codes appear and 29 have one person. Share ZIP-level data only after grouping it by county.

Social apps: where this audience spends time online

Figure 3 Social media apps. Share of all 163 people, with 95% intervals.

Facebook first. 139 people (85%) use Facebook, well ahead of Instagram (98), TikTok (84) and YouTube (74). Part of that lead comes from recruiting through Facebook groups, so read it as "the platform our people already share", not as a statewide ranking.

The people Facebook misses. Of the 24 who do not use Facebook, 11 use Instagram and 11 use YouTube.

A 95% interval shows how precise a share is for this group: Facebook is likely between 79% and 90%.

Time online: how much and when

Figure 4 Daily time on social media. Share of 163, with 95% intervals. Coral: three hours or more.

Figure 5 Usual times of day. Share of 163 choosing each time, in clock order, with 95% intervals. Coral: most common.

What it shows. Half spend three hours or more a day on social media. Before 9 AM is the most common usual time, followed by late afternoon and mid-morning.

The time question covered all platforms together and asked for two choices; 50 people gave one. It shows general habits, not when someone opens a particular app.

Heavier users: more of every app, not one app in particular

Figure 6 Average number of apps used, by daily time.

Figure 7 Share using each app, from under 1 hour (left) to 5+ hours a day (right). After accounting for other apps used, no rise is supported.

Facebook

Adjusted 1.72 (q 0.214)

Instagram

Adjusted 1.42 (q 0.230)

TikTok

Adjusted 1.51 (q 0.214)

YouTube

Adjusted 1.24 (q 0.504)

Snapchat

Adjusted 0.96 (q 0.958)

Pinterest

Adjusted 1.28 (q 0.599)

X (Twitter)

Adjusted 1.13 (q 0.861)

LinkedIn

Adjusted 0.98 (q 0.958)

What it means. People who spend more time online use more apps, about 1.6 at under an hour and 3.8 at five hours or more, so nearly every app looks more popular among heavy users. Once we account for how many other apps each person uses, no single app rises with time spent. Heavy users are an everything audience: reach them with the same message across apps.

Apps and usual times: how many people chose both

Figure 8 **Apps and usual times.** Each cell counts people who use the app and chose that time; darker cells mean a larger share of that app's users.

	Before 9	9-12	12-3	3-6	6-9	After 9
Facebook (139)	59	45	26	42	37	28
Instagram (98)	43	31	22	31	25	19
TikTok (84)	35	30	18	26	25	15
YouTube (74)	30	29	18	21	19	17
Snapchat (46)	25	13	14	13	11	9
Pinterest (28)	12	11	9	8	6	5
X (Twitter) (25)	13	8	12	4	3	6
LinkedIn (20)	11	10	5	3	2	5

How to read it. 59 people use Facebook and chose before 9 AM in general; that does not mean 59 people open Facebook before 9 AM.

What it shows. Every app shows the same pattern: early morning darkest, then mid-morning or late afternoon. That is the whole group's daily rhythm showing through each app, not an app-specific habit.

How to use it. Treat early morning, mid-morning and late afternoon as the windows to test first. Platform analytics, not this chart, should set the schedule.

Reach: how many different people each mix of apps covers

Figure 9 **How reach builds as apps are added.** Different people who use at least one app in the mix, out of 163. Mint bar: already reached; coral: newly reached. The four other apps are Snapchat, Pinterest, X and LinkedIn.

What it shows. Facebook alone covers 139. Instagram adds 11 new people, TikTok 1, YouTube 3, and the other four apps together 3. Most users are on several apps, so each extra app adds few new people.

What it means. In this audience a second app is mostly a second chance to reach the same people. Choose a second platform for the format it allows, such as short video, and judge it by the actions it adds rather than by new reach.

These are survey users, not ad delivery. Real reach depends on targeting, frequency and budget.

Websites: local news reaches half the audience

Figure 10 Website categories. Share of all 163 people, with 95% intervals.

What it shows. Shopping sites lead (110), but local news is the finding that matters most for us: 83 people (51%) read local news sites, and 35 read national news.

What it means. A large share of our audience already goes looking for local, factual information. News-style posts about Capital City and Riverside County roads, crashes and new laws meet them where they already read.

Streaming TV: which services this audience uses

Figure 11 Streaming TV services. Share of all 163 people, with 95% intervals.

What it shows. Netflix leads (126), followed by Amazon Prime Video (96) and Hulu (75). The average person uses 4.1 services, and local news apps reach 33 people (20%).

Service use is not ad exposure: someone may pay for an ad-free plan. See Ad-supported access (p. 18).

Audio: platforms and plans

Figure 12 Audio platforms. Share of all 163 people, with 95% intervals.

Figure 13 Music or radio plan. People out of 163.

● Free with ads ● Both free and paid ● Paid, no ads

What it shows. YouTube Music (76) and Pandora (75) lead, and 139 people (85%) use a free-with-ads plan or a mix of free and paid. Audio is a channel worth pricing.

Write-ins: Amazon Music 5, SiriusXM 3, radio or car radio 3.

Ad-supported access: what the survey can and cannot confirm

Figure 14 Streaming TV users who also use a free, ad-supported app. Coral: users of the service who also use some free app.

Figure 15 Audio users on a free or mixed plan. Coral: users of the platform on a free-with-ads or mixed plan.

How to read it. We asked about free apps in general, so 89 Netflix users using some free app does not mean they see ads on Netflix.

What it means. 92 people use both a free streaming app and a free or mixed audio plan, and only 8 use neither. Ask each seller for its own ad-supported audience in our counties before buying.

Combined coverage: how many different people each mix of services covers

Figure 16 **Combined coverage.** Different people who use at least one service in the mix, out of 163.

What it shows. Netflix with YouTube Music and Pandora covers 146 people (90%). Because most people use several services, a few large ones cover nearly everyone.

What it means. Use this list to decide which sellers to call first. Coverage counts users, not people who will see or hear our ads.

Channels we did not measure: broadcast TV and radio

What we know. We did not ask about broadcast TV or AM/FM radio as separate options. A few people wrote them in anyway: radio or car radio (3), SiriusXM (3) and cable TV (1).

What that does not mean. Few write-ins do not mean few viewers or listeners. People answer the options in front of them.

Channel	What this survey shows	Before you buy
Streaming TV	Strong use; ad plans unknown	Confirm local ad-supported audience and minimum spend
Digital audio	Strong use; most on free or mixed plans	Confirm local inventory by service
Broadcast TV	Not measured	Use market ratings data
AM/FM radio	Not measured; 3 write-ins	Use market ratings data

The next survey should ask directly which channels deliver ads people actually notice (Next survey, p. 55).

Volume 01 summary: the audience in brief

What we learned	What to do with it
Facebook reaches 85%; a second app adds few new people.	Distribute on Facebook first; add one second platform for its format.
Half spend three hours or more a day online; heavy users use every app more.	Keep one message across apps.
Early morning, mid-morning and late afternoon are the common usual times.	Test those windows; let platform data decide.
Local news websites reach 51%.	Write news-style local content.
Netflix, Prime, YouTube Music and Pandora cover most people; most use some free, ad-supported service.	Shortlist those sellers; confirm ad audiences before buying.
Broadcast TV and radio were not measured.	Use ratings data; ask about them next time.

VOLUME 02, WHAT TRAVELS TOGETHER

Connections

Know which interests truly travel together, and which only look connected.

Start with [How we tested connections](#) (p. 23). The central result is in [Show pairings](#) (p. 26).

02

WHAT TRAVELS TOGETHER

How we tested connections: and why box-ticking matters

The question. When someone chooses one answer, are they more likely to choose another? For each pair we count four groups and compare the odds.

Figure 17 How an odds ratio is built. Reality and lifestyle shows, 163 people. 1 means no link; above 1, chosen together; below 1, chosen apart.

Chance across many tests. We ran 383 tests, so some chance hits are certain. We control the false discovery rate within nine named groups of tests; a result is supported when its q value is below 0.05 (Benjamini & Hochberg, 1995).

Box-ticking. In "check all that apply" questions some people tick many boxes and some tick few (Smyth et al., 2006; Krosnick, 1991). A heavy box-ticker sits in almost every pairing, which can make unrelated interests look connected, so we test each pair again after accounting for how many options each person chose.

Tier	What it passed	How to use it
Tier 1	Supported before adjustment, after it, and under a strict permutation test	A firm basis for content
Tier 2	Supported before and after adjustment	A good basis for a test
Tier 3	Supported only before adjustment	Mostly box-ticking
Emerges	Supported only after adjustment	Real but hidden; confirm

Show genres: what people watch most

Figure 18 Streaming show types. Share of all 163 people, with 95% intervals.

Figure 19 How many genres each person chose. People out of 163.

Why this spread matters. 36 people chose one genre and 8 chose all seven. People who choose many genres appear in almost every pairing, which is why every connection in this volume is tested again after accounting for it.

Sports and teams: who follows what

Figure 20 Sports and teams followed. Share of all 163 people, with 95% intervals.

Figure 21 How local team following overlaps. People out of 163.

What it shows. Four in five follow State University, the pro team or both, and almost half follow both. Only 24 people (15%) follow none of the listed teams.

Show pairings: which interests truly go together

Figure 22 **Twelve pairings with any support.** Small hollow square: odds ratio before adjustment. Larger blue square and line: after adjustment, with its 95% interval.

What holds. Reality with lifestyle passes every test. Sports with news, family/kids with lifestyle, comedy with drama and drama with family/kids hold after adjustment.

What fades. Comedy with family/kids, family/kids with reality and three drama pairings look strong at first but mostly reflect box-ticking.

What appears. Drama viewers choose sports and news less often than expected, a pattern that only shows once box-ticking is removed.

The genre map: every pairing at a glance

Figure 23 Adjusted odds ratio for each pair of genres. Blue: chosen together; coral: chosen apart; pale cells: not supported after adjustment.

How to read it. Find one genre on the left and another along the top. The number is the odds ratio after accounting for box-ticking; the label below it is the evidence tier.

What stands out. A block of story genres (comedy, drama, family, reality and lifestyle) links together, with reality and lifestyle the strongest pair. Sports and news link to each other, and drama sits apart from both.

All 21 genre pairings: the full record

Pairing	Both	Before adjustment	After (95% interval)	Evidence
Sports and News	33	4.25	4.25 (2.14–8.47)	Tier 2
Reality and Lifestyle	33	5.46	4.17 (1.93–9.01)	Tier 1
Family/Kids and Lifestyle	33	4.15	3.12 (1.45–6.73)	Tier 2
Comedy and Drama	66	2.87	2.73 (1.38–5.37)	Tier 2
Drama and Family/Kids	50	2.51	2.35 (1.21–4.55)	Tier 2
Family/Kids and Reality	42	3.03	2.27 (1.14–4.51)	Tier 3
Comedy and Family/Kids	57	2.89	2.26 (1.12–4.56)	Tier 3
Drama and Lifestyle	33	2.53	2.20 (1.02–4.75)	Tier 3
Drama and Reality	45	2.27	2.03 (1.03–4.01)	Tier 3
News and Lifestyle	22	2.12	1.99 (0.93–4.25)	Not supported
Comedy and Reality	52	2.80	1.97 (0.95–4.10)	Tier 3
Comedy and Sports	43	1.81	1.76 (0.86–3.59)	Not supported
Reality and News	27	1.50	1.33 (0.65–2.69)	Not supported
Family/Kids and Sports	28	1.04	0.87 (0.44–1.74)	Not supported
Comedy and Lifestyle	34	1.78	0.86 (0.37–2.01)	Not supported
Sports and Lifestyle	18	1.09	0.85 (0.39–1.87)	Not supported
Reality and Sports	25	1.00	0.78 (0.38–1.60)	Not supported
Comedy and News	35	0.96	0.73 (0.35–1.53)	Not supported
Family/Kids and News	24	0.82	0.57 (0.27–1.20)	Not supported
Drama and News	25	0.54	0.40 (0.19–0.81)	Emerges
Drama and Sports	26	0.49	0.35 (0.17–0.72)	Emerges

Shaded rows hold up. Every pairing is also on the Pairwise Tests sheet of the workbook.

Viewer groups: selective viewers and broad story viewers

Figure 24 Chance of choosing each genre, by viewer group.

● Selective viewers (71%) ● Broad story viewers (29%)

Two groups. Broad story viewers (29%) chose about 5.2 genres, mostly comedy, drama, family, reality and lifestyle. Selective viewers (71%) chose about 2.3.

What both groups share. Both chose sports (37%) and news (33–38%) at the same rate. Practical, news-style information suits everyone; story-led content suits the broad story group best.

Broad story viewers also used more apps (4.0 versus 2.9) and were more likely to use Instagram (80% versus 53%).

How the viewer groups were found

The method. Latent class analysis looks for groups of people whose answers follow the same pattern (Collins & Lanza, 2010). We fitted models with one to five groups and compared them.

Figure 25 **Model comparison.** BIC by number of groups; lower is better. The two-group model (blue) fits best.

Why two groups. BIC balances fit against complexity. In 40 resampled datasets the two-group model won 24 times and the three-group model 16.

Three-group model (tentative)	Share	Comedy	Drama	Sports	News
Selective viewers	64%	48%	36%	40%	36%
Story-only viewers	25%	91%	94%	11%	3%
Everything viewers	11%	87%	73%	76%	94%

A lead to confirm. A story-only group that almost never chooses sports or news may exist. It is not stable enough to plan around yet.

Sports: what following a team does and does not tell you

Figure 26 Share choosing sports shows: non-followers versus followers of each team. Hollow square: non-followers. Blue square: followers. Right: evidence after adjustment.

Question	Answer
Does following a team mean watching sports shows?	Only for the NFL (adjusted odds ratio 3.88). Of 128 State University or the pro team followers, 52 chose sports shows and 76 did not.
Do NFL, NBA and college football fans overlap?	Yes: NFL with NBA and with other college football (adjusted odds ratios 5.22 and 4.41).
Do State University and the pro team fans overlap?	Across all 163, strongly, because the 24 non-followers choose neither. Among team followers, following one does not predict the other.

What it means. Local teams are a shared reference for four in five people, a natural backdrop for a community story, not a signal that sports-styled legal content will work better. Keep game-day framing for NFL-oriented placements.

Leaving the 24 "None" answers out changes several team results; the workbook's Coding Sensitivity sheet shows both ways.

Shows, websites and services: consistency checks, not discoveries

Figure 27 Shows, websites and services. Small hollow square: before adjustment. Blue square and line: after, with 95% interval.

Why the strongest links are not news. Someone who watches sports shows will usually visit sports websites. The top five pairs show the questions work as intended; they are not new facts about the audience.

What it means. Which streaming service a person uses says little about which story will reach them. Choose services by local ad audience and cost, and choose creative by testing.

Content by platform: no interest belongs to one app

Figure 28 Every interest-by-app link that looked supported, before and after adjustment. Hollow square: before. Blue square and line: after, with 95% interval; every line crosses or nears 1.

What it shows. Twelve of 112 interest-by-app tests look supported at first. None holds once we account for how many apps and how many show or site types each person chose.

What it means. Use the same core content on each platform and adapt only the format. Let each platform's analytics show whether an idea performs differently there.

Timing: what the survey can and cannot say

Figure 29 Usual times: Facebook users compared with everyone. Share choosing each time.
● Facebook users (139) ● Everyone (163)

What it can say. Facebook users choose times in almost the same proportions as everyone else, with early morning first.

What it cannot say. We asked about usual times across all apps, so the survey cannot tell you when people use Facebook or when a post will perform best. Splitting answers by app, content and time leaves groups of two to four people, far too few to compare.

What to do. Rotate equivalent posts across early morning, mid-morning and late afternoon, and let platform data decide (The test portfolio, p. 51).

Volume 02 summary: the connections that matter

What holds	What it means for us
Reality with lifestyle (Tier 1)	Everyday-life situations are the firmest base for stories.
Sports with news; interest equal in both viewer groups (Tier 2)	Practical, news-style answers suit everyone.
Family/kids with lifestyle (Tier 2)	Household logistics after a crash are a natural story setting.
Comedy with drama (Tier 2)	A human turn with a warm close; never humor about injury.
Drama apart from sports and news (Emerges)	Story content and news content reach partly different people; make both.
NFL with sports shows (Tier 2)	Game-day framing only in NFL-oriented placements.
Two viewer groups: 71% selective, 29% broad story	Two tracks: answers for all, stories for some.
No platform-specific interest; no best posting hour	One message everywhere; test timing.

Direction

Turn what the audience told us into content, channel and buying decisions that keep one recognizable firm.

Start with [Four principles](#) (p. 37). Writers go to [Content pillars](#) (p. 39).

03

Four principles: from findings to content

Principle	What it asks of us	Evidence
1. Answer first, for everyone	Open with a practical next step after a wreck, in plain words, in the first few seconds.	News-style interest is equal across viewer groups; 51% read local news
2. Tell everyday stories for those who want them	Show a real-life moment (the insurance call, the school pickup with no car) before the help.	Reality with lifestyle (Tier 1); family with lifestyle and comedy with drama (Tier 2); 29% broad story viewers
3. Stay close to home	Use Capital City and Riverside County roads, places and news. Local teams can set the scene, never sell the message.	83 read local news; 79% follow State University or the pro team; ZIP A is our largest ZIP
4. One message everywhere, judged by actions	Keep the same idea and brand assets on every channel; measure the case-evaluation button submissions, verified leads and signed cases.	Facebook reaches 85%; no platform-specific interest; survey cannot predict persuasion

The moments after a wreck: where people need us

The idea. People think of a category in particular situations, which Romaniuk and Sharp (2016) call category entry points. For an injury firm, those are the moments after a crash when a question appears. Content that owns those moments is remembered when they arrive.

Moment	The question people have	Pillar
At the scene	What do I photograph, and who do I call?	Next Steps
The first insurance call	What should I say, and what should I not say?	Next Steps
The repair shop or rental counter	Who pays while my car is out?	Next Steps
The doctor visit days later	Does a delayed injury still count?	Life After a Crash
Missed work and the school run	How do we keep the household moving?	Life After a Crash
The local news story	That road again: what should drivers know?	Close to Home
Game day and weekend travel	How do we all get home safely?	Close to Home

Each moment becomes a content brief. Legal answers need attorney review before publishing.

Content pillars: Next Steps

What it is. Short, practical answers to the questions that follow a wreck: what to record, which insurance details matter, when legal help makes sense. One question, one next step.

Why it leads. Interest in news-style information is the same in both viewer groups, and half the audience reads local news. This pillar suits everyone.

Format	Example
Social graphic or carousel	"After a crash, three things to save before the insurance call."
15-30 second video	An attorney answers one insurance question without jargon.
Blog or news post	An attorney-reviewed explainer, such as how Southstate's 51-percent fault rule works.
15-second audio	One first step, the firm name and [Battlecry].
Chat prompt	"Have a question after a wreck? Ask the chat widget."

Call to action. The case-evaluation button for the Case Evaluation Tool; mention the DIY Insurance Claim Checklist by name.

Boundary: never say what a reader's case is worth, whether it is strong, or that the firm will take it.

Content pillars: Life After a Crash and Close to Home

Life After a Crash. Stories about the days after a wreck: getting to work with no car, a delayed injury, a stack of letters. The human moment comes first, then one practical step and a caring close. Use consented client accounts or scenes clearly labeled as illustrations.

Why: reality with lifestyle is the firmest pairing, and broad story viewers (29%) choose everyday-life, family and drama together. Narratives engage when the reader is carried into the story (Green & Brock, 2000; Braddock & Dillard, 2016).

Close to Home. Local road updates, crash-season reminders, new Southstate driving laws, and safe trips home from games and community events. Name real places in Capital City and Riverside County. Teams can be the setting; the message stays road safety and help.

Why: local news reaches 51%, local teams 79%, and our largest ZIP is home to our Riverside office. Boundary: no team logos, uniforms or implied endorsement.

How the pillars fit together. Next Steps runs every week for everyone. Life After a Crash adds stories for those who want them. Close to Home keeps both rooted locally. All three end with the same brand assets and one next action.

The weekly rhythm: fitting the pillars to the Q4 calendar

Weekly angle	What it is	Best-fit pillar	Evidence
Tuesday: In Your Corner	Client advocacy, reviews, team faces	Life After a Crash	Reality with lifestyle (Tier 1); broad story viewers
Thursday: Know the Playbook	Insurance tactics, checklists	Next Steps	Sports with news (Tier 2); equal across groups
Saturday: Quick Answers	Curiosity-led, chat widget and quiz	Next Steps, short form	Same; the chat widget as the action
Any day, as news breaks	Local road and crash updates	Close to Home	Local news sites reach 51%

What the survey supports. The three weekly angles line up with what this audience chooses: two practical angles that suit everyone and one story angle for broad story viewers.

What it cannot settle. Whether two or three posts a week works better. The survey has no answer; a switchback test can give one (The test portfolio, p. 51).

On Facebook, upload natively and put links in the first comment.

Tone: warm, plain and credible

Warmth, not jokes. Comedy is the most chosen genre, but humor can lift attention while hurting credibility, and it carries real risk when the subject is injury (Weinberger & Gulas, 1992). Use warmth in how attorneys and staff speak; never make the wreck or the injury the joke.

Safety, not scare. Fear appeals work best when people are shown a clear action they can take; fear without a path forward tends to produce avoidance (Witte & Allen, 2000). Pair any risk message with one concrete step, and avoid graphic crash imagery.

Credible voices. A message persuades more when its source is seen as expert and trustworthy (Pornpitakpan, 2004). Let named attorneys explain, show the date and review on legal content, and keep claims modest.

Plain words. Write at about a fifth-grade reading level. Short sentences. One idea at a time.

Do	Do not
Answer a real question in the first few seconds	Open with claims about the firm
Treat people as people, never as case numbers	Use graphic fear or mockery
Use consented stories or labeled illustrations	Present invented scenes as real clients
Keep legal guidance factual and reviewed	Promise results, speed or amounts

Brand assets: the same signature everywhere

Why consistency wins. People notice and remember brands through distinctive assets repeated across every touchpoint (Sharp, 2010). With an audience that sees us on several apps, the same signature on every piece builds recognition faster than varied looks.

Asset	Use it
Firm name: The Firm	On every piece, spoken and written
Battlecry: [Battlecry]	As the closing line of video, audio and long-form content
Action names: The case-evaluation button, the chat widget, the phone line, the contact form	Each name always points to one thing: the Case Evaluation Tool, the chat widget, the phone line, the contact form
Hashtags: The two branded hashtags	Social posts only; no other branded hashtags
House colours, type and logo	Navy, white, action blue and brand red; the logo in the header only

One idea across channels. When a wreck turns your day upside down, we give you straight answers and real care. [Firm name]. [Battlecry].

Channels: one idea, a different job for each

Channel	Job	What good looks like
Facebook	Main distribution to the people we already reach	Native video and graphics; link in the first comment; three weekly angles
Instagram, TikTok or YouTube	A second chance at the same people, in short video	Reformatted Next Steps and story clips
Website and blog	Complete, reviewed answers and the conversion path	The case-evaluation button early, the chat widget mid-page, the phone line and the contact form near the end
Google Business Profile	Local proof and directions	Current hours, offices, updates, reviews
Streaming TV and audio	Wider awareness, after inventory is confirmed	30-second story; 15-second audio with one first step
Email newsletter and SMS	Keep former clients and friends informed	One useful resource and a permission-based invitation

Buying streaming TV and audio: what to confirm first

Start with the shortlist. Netflix, Amazon Prime Video, Hulu, YouTube Music and Pandora cover most of this audience (148 of 163 use at least one of Netflix, Prime, YouTube Music or Pandora).

Ask each seller	Why
How many ad-supported viewers or listeners do you have in Capital County, Riverside County and nearby counties?	The survey measured service use, not ad plans
What is the minimum spend and flight length?	Small budgets may not reach testable delivery
Can you hold out matched ZIP codes or counties?	Lets us measure lift, not just exposure (The test portfolio, p. 51)
What frequency caps and completion reporting do you offer?	Repeating one ad too often wastes budget
Can we pass a tracked link or code to the site?	Connects exposure to the case-evaluation button and calls

Creative to run first. A 30-second Life After a Crash story on streaming TV and a 15-second Next Steps reminder on audio, both closing with [Battlecry].

Search: commercial pages and helpful local answers

Two kinds of page. Our commercial pages answer "I need a lawyer": Capital City Car Accident Lawyer, Capital City Truck Accident Lawyer and Southstate Car Accident Lawyer. Blog and news posts answer specific problems, such as an insurance question or a local crash. Keep the two jobs separate so posts do not compete with the commercial pages.

Why local news-style posts fit. Half this audience reads local news sites. Short, factual posts about Capital City and Riverside County roads, crashes and new laws meet them in a familiar format and link naturally to the commercial pages.

What search engines reward. Google's guidance favors people-first content written from real expertise (Google Search Central, n.d.). Show the reviewing attorney, the date, sources and limits on every legal answer.

Measure	What it tells you
Non-branded impressions and clicks for car and truck wreck searches	Whether people find us
Engagement on the three commercial pages	Whether they read
The case-evaluation button submissions and calls from organic search	Whether they act

Compliance: the standards every piece must meet

The rules. The Southstate Rules of Professional Conduct, Rules 7.1 to 7.10, govern lawyer advertising and solicitation. General public content and targeted outreach are treated differently, and attorney review comes before anything targeted and before any post publishes.

Never	Always
Say a reader's case is strong, weak or worth an amount	Show care first, then offer help
Promise a win, a payment or that the firm will take the case	Keep legal statements factual, sourced and reviewed
Call the Case Evaluation Tool a calculator, score or estimator	Use the official action names
Use team logos, uniforms or imply a team endorsement	Get written consent for client stories and reviews
Present an illustration as a real client	Label illustrative scenes

Data care. The survey data contain ZIP codes. Share results by county, never by individual ZIP, outside the marketing team.

Volume 03 summary: direction in brief

Decision	Detail
Three pillars	Next Steps for everyone; Life After a Crash for broad story viewers; Close to Home for both
Own the moments after a wreck	Seven moments, from the scene to the doctor visit, each a content brief
Map to the weekly rhythm	Tuesday stories; Thursday and Saturday answers; local news as it breaks
Warm, plain, credible tone	Warmth not jokes; safety not scare; named, reviewed attorney voices
One signature	Firm name, [Battlecry], the four action names, two hashtags, house style
Facebook first, then one short-video app	Streaming TV and audio once inventory is confirmed
Compliance on every piece	Southstate Rules 7.1 to 7.10; attorney review

Proof

Know how to test, measure and decide, and what the next survey must ask.

Start with [Why we test](#) (p. 50). Each test is sized in [The test portfolio](#) (p. 51).

04

HOW WE WILL KNOW

Why we test: a survey cannot predict what persuades

What the survey gives us. A clear picture of who our audience is and which interests travel together. That tells us what to try first.

What it cannot give us. Which message brings in a signed case. Even large advertisers find ad effects hard to measure: individual outcomes are noisy and true effects are small, so tests need more volume than people expect (Lewis & Rao, 2015).

Why comparisons beat before-and-after. When the same campaigns were measured both ways, randomized experiments and observational comparisons often disagreed, sometimes widely (Gordon et al., 2019). We compare matched versions at the same time, not this month against last month.

Our rule. Every idea in Volume 03 is a hypothesis until a test says otherwise. Decide the measure, the smallest difference worth acting on and the stopping date before launch (Kohavi et al., 2020).

The test portfolio: five tests and what each settles

Test	Compare	Primary measure
Message	A Next Steps answer against a Life After a Crash story; same offer, length and action	The case-evaluation button submissions per eligible visit
Setting	Close to Home version naming local roads against a general version	Engaged visits and the case-evaluation button submissions
Delivery	Warm against neutral delivery of the same attorney script	Trust and clarity rating plus guide clicks
Posting cadence and windows	Two against three posts a week in alternating weeks; posts rotated across early morning, mid-morning and late afternoon	Reach and actions per post and per week
Lift	Streaming TV or audio in some counties or ZIP groups, held out in matched ones	Extra the case-evaluation button submissions and calls in exposed areas

Order. Run message and cadence first: they use channels we already own. Run setting and delivery next. Run lift once a seller confirms inventory and a holdout.

Sample sizes: how much volume each test needs

Figure 30 Eligible visits needed for a clear answer. Total across both versions; two-sided test, 5% significance, 80% power.

What this means. Submission and lead tests need thousands of visits. If a channel delivers fewer, judge the test on an earlier action such as checklist clicks, and confirm the winner with leads over the following months.

Signed cases. Signed cases are too few to compare within one test. Track them for every version and review them quarterly.

Change the rates on the workbook's Sample Size sheet.

Measurement: from seen to signed

Figure 31 From seen to signed.

Stage	Measure	Source
Seen	Reach, completed views and listens, frequency	Platform and seller reports
Engaged	Saves, guide and checklist clicks, engaged sessions	Platforms and Google Analytics
Raised a hand	The case-evaluation button submissions, the chat widget conversations, the phone line calls, the contact form forms	Site, chat and call tracking with UTM tags
Verified lead	Leads confirmed as motor-vehicle collision matters	Intake
Signed case	Signed cases; cost per verified lead and per signed case	Case management

Decision rule. Pick a winner only on the stage the test was designed for, with the planned sample, at the planned stopping date. Do not choose from likes or one good week.

Data rule. Tag every piece with pillar, format, channel, date and action, following the firm's attribution standard. Deduplicate leads and separate first touch from assisted touches.

The next three months: November 2026 to January 2027

Figure 32 The next three months. Blue: set-up. Coral: tests running. Mint: read and decide.

November. Brief writers on the three pillars and seven moments; produce matched Next Steps and Life After a Crash versions; confirm UTM tags and intake verification; write each test's measure, size and stopping date.

December. Launch the message test and the posting cadence switchback on owned channels; begin the setting test; agree a holdout plan with one seller.

January. Read the tests at their planned dates, keep what wins, retire what does not, field the next survey wave and update this compendium.

Next survey: what the 2027 wave should ask

Change	Why
Offer "None of these" and "Prefer not to say" separately	Separates a real "no" from a skipped question
Ask time of use for each app	Makes app-specific timing measurable
Add age band and gender	Lets us adjust for what likely drives app use and box-ticking
Ask why people follow a team and what they enjoy in a show	Measures motives instead of guessing them
Ask what makes a law-firm message trustworthy and what people need first after a wreck	Connects content to real needs
Ask which channels deliver ads people notice, including broadcast TV and radio	Measures exposure, not just use
Add one attention check; record how each person was invited	Protects data quality; compares networks
Recruit beyond our networks, starting with the 103 panel volunteers as one source	Reduces clustering and the Facebook tilt

How many people. To detect an odds ratio of 2 for an interest held by a quarter of people, with groups about 3 to 1, plan for about 403 valid responses. Aim for 350 to 450.

Limits: what this evidence cannot carry

Limit	What it means for you
Who answered	163 people recruited through our networks. Results describe them, not all residents or all people who need a lawyer (Baker et al., 2013).
Close-knit answers	46 people share one ZIP code. Results held in clustered checks, but precision is lower than the intervals suggest.
Self-report	People told us what they use. We did not observe viewing, exposure or reasons.
Associations, not causes	Interests that go together do not tell us what persuades.
Many tests	383 tests. False discovery control limits chance findings; rely on Tier 1 and Tier 2.
Missing variables	No age or gender, which likely shape app use and box-ticking.
Time	Collected in late 2025. Services, ad plans and inventory change.

The bottom line

What we learned. Our audience lives on Facebook, reads local news, streams Netflix, listens on YouTube Music and Pandora, and follows State University and the pro team. Practical, news-style information interests all of them. A smaller group of broad story viewers also wants everyday-life stories. No platform has its own audience for content.

What we will do. Lead every channel with Next Steps answers. Add Life After a Crash stories. Keep everything Close to Home. Use one signature, [Battlecry], everywhere, starting on Facebook.

How we will know. Run five matched tests, sized in advance, and judge them by the case-evaluation button submissions, verified leads and signed cases. Ask better questions in the 2027 survey.

Why it matters. Nobody plans for a wreck. When one happens, the person looking for help reaches for a name they already know and trust. Our job is to earn that place before the day arrives.

HOW IT WAS MADE

Methods, results and references

Check how every number was produced and where to find it in the workbook.

Start with [Appendix A](#) (p. **59**). Every result that holds is in [Appendix B, continued](#) (p. **61**).

A

HOW IT WAS MADE

Appendix A: statistical methods

Tool	What it does	Reference
Share with 95% Wilson interval	Precision of a percentage for this group	Wilson (1927)
Odds ratio with 95% interval	How much more likely people who chose A were to choose B	Agresti (2013)
Phi and phi max	Correlation for two yes/no answers beside its largest possible value	Agresti (2013)
Fisher exact test	Whether a 2-by-2 pattern could easily be chance	Agresti (2013)
False discovery rate (q)	Controls chance findings within nine families of tests	Benjamini and Hochberg (1995)
Box-ticking adjustment	Logistic regression with the number of other options chosen	Agresti (2013)
ZIP-cluster check	Allows for people in the same ZIP answering alike	Cameron and Miller (2015)
Permutation stress test	2,000 reshuffles keeping each person's number of genres and each genre's total fixed	Strona et al. (2014)
Latent class analysis	Groups of people with similar answer patterns; one to five groups, 60 starts each	Collins and Lanza (2010)
Sample size	Normal approximation, two-sided, 5% significance, 80% power	Kohavi et al. (2020)

Analysis in Python (SciPy and statsmodels). Counts, odds ratios and intervals are also live Excel formulas in the workbook.

Appendix B: results by test family

Figure 33 What happened to every supported result, by test family. Blue: holds (Tier 1 or 2). Mint: fades after adjustment (Tier 3). Coral: emerges after adjustment.

Test family	Tests	Supported before	Tier 1 or 2	Tier 3	Emerges
Genre x genre	21	10	5	5	2
Team x genre	35	7	1	6	0
Team x team	10	4	3	1	0
Genre x website	49	4	3	1	1
Genre x TV service	84	4	2	1	1
Team x TV service	60	1	0	1	0
Ad-supported x genre	7	0	0	0	0
Ad-supported x team	5	1	0	1	0
Show/site x platform	112	12	0	12	0
Total	383	43	14	28	4

Comedy with Apple TV+ is counted as supported before adjustment but is too sparse to adjust (all 14 Apple TV+ users chose comedy), so it appears in no tier. Every test is on the Pairwise Tests sheet of the workbook.

Appendix B, continued: every result that holds

Family	Pairing	Adjusted odds ratio (95%)	Evidence
Genre x TV service	News and Local news apps	13.08 (4.93–34.71)	Same interest twice
Genre x TV service	Family/Kids and Disney+	5.06 (2.36–10.82)	Same interest twice
Genre x TV service	News and Disney+	0.24 (0.11–0.55)	Emerges
Genre x genre	Sports and News	4.25 (2.14–8.47)	Tier 2
Genre x genre	Reality and Lifestyle	4.17 (1.93–9.01)	Tier 1
Genre x genre	Family/Kids and Lifestyle	3.12 (1.45–6.73)	Tier 2
Genre x genre	Comedy and Drama	2.73 (1.38–5.37)	Tier 2
Genre x genre	Drama and Family/Kids	2.35 (1.21–4.55)	Tier 2
Genre x genre	Drama and News	0.40 (0.19–0.81)	Emerges
Genre x genre	Drama and Sports	0.35 (0.17–0.72)	Emerges
Genre x website	Sports and Sports sites	11.62 (5.11–26.42)	Same interest twice
Genre x website	News and National news sites	3.64 (1.61–8.25)	Same interest twice
Genre x website	News and Local news sites	3.44 (1.69–7.00)	Same interest twice
Genre x website	Sports and How-to/health sites	0.23 (0.08–0.62)	Emerges
Team x genre	NFL and Sports	3.88 (1.86–8.08)	Tier 2
Team x team	NFL and NBA	5.22 (2.21–12.31)	Tier 2
Team x team	NFL and Other college football	4.41 (1.84–10.56)	Tier 2
Team x team	State University and the pro team	3.88 (1.94–7.78)	Tier 2

Appendix C: codebook

Field	Format	Coding
Survey ID	Text	Respondent code; not analyzed
Home ZIP code	Text	Described; group by county before sharing
Social media apps	Check all	8 options, 1 or 0; "None" = 0
Free ad-supported streaming	Yes or no	1 = yes
Daily social media time	One choice	Four ordered groups
Streaming show types	Check all	7 options, 1 or 0; "None" = 0
Streaming TV services	Check all	12 options, 1 or 0; "None" = 0
Sports and teams	Check all	5 options, 1 or 0; "None" = 0
Website categories	Check all	7 options, 1 or 0; "None" = 0
Audio platforms	Check all	6 options, 1 or 0; write-ins merged
Music or radio plan	One choice	Free, paid or both
Times of day	Select two	6 options, 1 or 0; described only
Join survey team	Yes or no	Described only

Write-ins were trimmed and merged (Amazon and Amazon Music; Next door and Nextdoor; Sirius and SiriusXM; radio and car radio) and are described, never tested.

Appendix D: data and reproducibility

Workbook sheet	What it holds
Read Me	Coding rules, definitions and the colour convention
Clean Flags	Every respondent's coded answers, breadth counts and viewer group
Frequencies	Every share with its 95% interval, as live formulas
Pairwise Tests	All 383 tests: counts, odds ratios, q values, adjusted results and tier
Coding Sensitivity	Team results with "None" counted and with it left out
Media Reach	App and service combinations, daily time by app, apps by usual time
Latent Classes	Model fit, group profiles and the tentative three-group model
Sample Size	Test and survey sizes with editable rates

Checking a number. Find its row on Pairwise Tests or Frequencies, click the cell, and follow the formula back to Clean Flags.

Data source: The Firm (2025), Audience Voices audience media consumption survey, 163 valid anonymized responses.
